

Logout behavior

All pages except for the login page are presumed to require an active session to view (in practice, this means that the @login_required decorator is added to all view functions).

If a page which requires authentication is navigated to manually by an unauthenticated user, the user will be automatically redirected to the login page.

It is also presumed that every page which requires authentication will contain a 'logout' link which, when pressed, will immediately terminate the current session and return the user to the login screen.

User's alternate email address (usually a

personal email address).

User Group Built-in Django class. Holds credentials used to authenticate a user, as well as some minimal Built-in Django class. Holds groups of permissions which can be applied to a profile information. particular user.
